

## Experiment-2

### Cryptanalysis of RSA

Date: 21-08-24

#### AIM

Implementation of Cryptanalysis using RSA.

#### PROCEDURE

- Step-1: Install VMWare and host Kali Linux.
- Step-2: Login to Kali Linux and open Terminal and run commands.
- Step-3: Use Hexadecimal to decimal convertor.
- Step-4: Use factordb.com to find the factors for the decimal value.
- Step-5: Write an exploit in python and get the plain text.

#### SOURCECODE

```
* Open vmware, go to kali, open terminal.  
* For op, moving directory to desktop  
- (kali@kali) - [~]  
cd desktop  
* In desktop create folder rsa. copy  
these 3 files enc.txt exploit.py pubkey  
- y.pem in folder.  
* → cd rsa  
→ (kali@kali) - [~/Desktop/rsa]  
ls  
enc.txt exploit.py pubkey.pem
```

\* Open enc.txt file

```
$ cat enc.txt
```

$\frac{1}{\sqrt{2}} \begin{pmatrix} 1 & i \\ 0 & 1 \end{pmatrix}$

→ open pubkey.pem

\$cat pubkey.pem

—BEGIN PUBLIC KEY—

MSBW DRYTKZTHVCNASEBBGADUWAWUATJATM

SK/b+So2Emjj8R042t5FdL06WHMMVWUP01Z01

- P463B\*F8 / QJ RQ0a J6m FHR1MTn G5Jq v5 / Jzv

UJHTBZ/UNJMOVY400ZQOWIDAGAB

— END PUBLIC KEY —

\* The Below Command is used to display the details of public RSA key stored in PEM File Format.

```
$ openssl rsa -pubin -inform PEM -text
```

-порт < Р4Ькеу.рет

RSA Public-key: (576 bit)

Modulus:

00:c2:cb:b2:4f:db:f9:23:b6:12:68:c3:f1:d  
96:de:45:74:b3:b2:59:77:38:

96:de:45:74:b3:b9:58:73:0c:bd:65:09:38:86:

Ponent: 65537 (0x10001)

Copy the hex...

Exponent: 65537 (0x10001)

\* copy the hexadecimal decimal code into a notepad as n value. AS it is a hexadecimal we can convert it into decimal to gain the plaintext.

## Hexadecimal to decimal converter

Hexadecimal to decimal Converter	
Hex value (max 7FFFF)	Decimal value
00C2C6B34F923561	953190660
<input type="button" value="convert"/>	

paste the decimal code in the notepad as n value.

→ need to factorize n.

→ So go to website [factordb.com](http://factordb.com) click search, paste decimal value of n.

search	sequences	report results	factor tables	status	download	login
Additional information (Internal ID: 110083486)						
status(?) digits number						
C 174 (show) 1881988129...59 = 398075804...17						
.427277537						

\* create a exploit.py

\$ touch exploit.py

→ To install pycrypto

\$ pip install pycrypto

\* copy the code in the exploit.py file and paste it

n = 188198812920607963869723946  
16504398071635633794173827007  
633564229888597152  
e = 65537

p = 3980750864240649373971255  
005568649119906436234252  
6708406851897579463889572  
61

q = 47277214610743530253622307

## OUTPUT

197304822463291469530297114645

9852171130520711

$\phi - n = (p-1) * (q-1)$

$d = \text{inverse}(e, \phi - n)$

$\text{key} = \text{RSA.construct}(n, e, p, d, q)$

$\text{fn} = \text{"private.pem"}$

with open( $\text{fn}$  "wb") as f:

$\text{f.write}(\text{key.exportkey}())$

)

→ python exploit.py

→ to decrypt the text

$\text{openssl} \text{ pkeyutl} -\text{decrypt} -\text{in} \text{ enc.txt}$

$-\text{out} \text{ dec.txt} -\text{inkey} \text{ private.pem}$

→ \$ cat dec.txt

rsa is easy.

0/21/2

## Experiment-2

### Cryptanalysis of RSA

Date: 12-8-24

#### AIM

Implementation of Cryptanalysis using RSA.

#### PROCEDURE

- Step-1: Install VMWare and host Kali Linux.
- Step-2: Login to Kali Linux and open Terminal and run commands.
- Step-3: Use Hexadecimal to decimal converter.
- Step-4: Use factordb.com to find the factors for the decimal value.
- Step-5: Write an exploit in python and get the plain text.

#### SOURCECODE

##### Steps

1. create a folder name 'rsa' in kali linux desktop
2. open browser in github download three files.  
enc.txt exploit.py pubkey.pem
3. Copy those three files and paste in  
rsa folder.

4. Now open cmd in kali and type commands

→ \$ cd Desktop

→ \$ cd rsa

→ \$ ls

It lists all the files as follows.  
enc.txt exploit.py pubkey.pem

→ \$ cat pubkey.pem

It is used to access the content of the file.

→ \$ openssl rsa -pubin -inform PEM -text -noout <  
pubkey.pem

→ \$ touch exploit.py

→ \$ pip install pycryptodome

→ \$ python exploit.py

→ \$ openssl pkeyutl -decrypt -in enc.txt -out  
dec.txt -inkey private.pem

→ \$ cat dec.txt

It displays output as

\$ RSAisEasy
